

A KEY PART OF NY'S CLEAN ENERGY FUTURE: *Now Fully-Energized & In-Service*

Completed in June 2023, the New York Energy Solution:

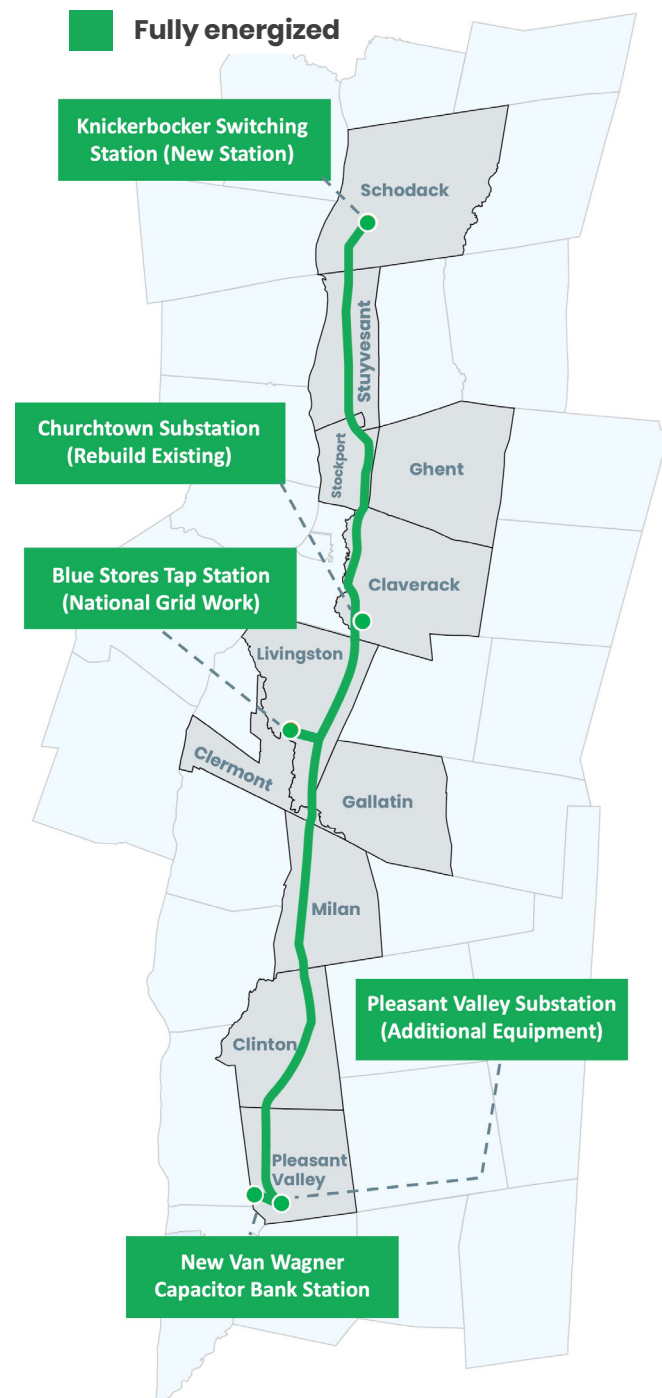

Modernized a 55-mile electric transmission corridor through Rensselaer, Columbia and Dutchess counties – with all construction taking place on the existing utility corridor or other utility-owned lands.

Installed a new 345kV transmission line that will help alleviate energy bottlenecks to efficiently deliver renewable energy to customers and help New York State meet its goal of 70% renewable energy by 2030.

Replaced 80-year-old lattice structures with modern monopoles (approximately 230 fewer), improving the reliability and resiliency of the electric transmission network, particularly during extreme weather events.

Post-construction corridor restoration will continue into 2024.
